- With the sharp rebound in stocks since December, we believe it is not time to chase the entire sector now. There is still about 20% downside for the property market in 1H09. Stock prices tend to lead the physical market by about four months and we believe the best time to revisit the whole sector will be toward the end of 1Q09. In the meantime, the sector is likely to be range bound on news flow. The upcoming launches of the Cullinan and Lake Silver by SHKP and Sino Land/MTRC, respectively, are expected to be key sector catalysts.
- By assessing a checklist of seven factors (loan-to-deposit ratio, corporate gearing, mortgage rate, income growth, wealth impact, housing supply and demographic changes), we conclude that the property market is considerably stronger now than during the last down cycle – as highlighted below, the lower the score of each factor, the better. The key differentiating factors are the low level of leverage in the system and limited supply for the next few years.
- Office rents are staying firm for the time being, but we expect more downside in 2009 when vacancy rates could start to climb. For retail rents, we would not be surprised to see mass and prime shopping mall rents fall by 20% and 15%, respectively, in 2009 as private consumption shrinks.
- We continue to stick with the sector leaders. Our top picks among the developers are Cheung Kong and Sun Hung Kai Properties. Among the landlords, Great Eagle has limited rental reversion pressure in 2009, while Wharf and Swire also remain top picks because of their decentralised office and prime shopping mall exposure.

#### Scores – property market health (1 = best, 10 = worst)

|                       | 2008 peak   | 2003 trough | 1998 trough | 1997 peak   |
|-----------------------|-------------|-------------|-------------|-------------|
| Loan-to-deposit ratio | 3.3         | 3.5         | 7.0         | 9.3         |
| Corporate gearing     | 3.0         | 8.0         | 8.0         | 6.0         |
| Mortgage rate         | 2.0         | 1.0         | 10.0        | 10.0        |
| Unemployment rate     | 2.9         | 8.4         | 6.1         | 1.1         |
| Wealth impact         | 5.0         | 9.0         | 8.0         | 2.6         |
| Housing supply        | 1.0         | 6.8         | 5.3         | 3.8         |
| Demographics          | 7.1         | 8.4         | 6.8         | 5.9         |
| <b>Total</b>          | <b>24.2</b> | <b>45.1</b> | <b>51.2</b> | <b>38.7</b> |

# From dusk to dawn

## Cheap but not distressed anymore

From their recent trough discounts of 51% and 53% for the developers and investors, respectively, property stocks have rebounded on average by about 34-41%. With the sector currently trading at 32% and 39% discounts to NAV for the developers and investors, respectively, valuations remain cheap but not distressed anymore. While we are still expecting 20% further downside in the residential market, mostly concentrating in 1H09, and given the sector tends to lead the physical market by about four months, we believe the best time to start considering bottom fishing is only at the end of 1Q09.

In the meantime, we would continue to stick with the sector leaders. Our top picks among the developers are Cheung Kong and Sun Hung Kai Properties. Among the landlords, due to the potential negative take-up in the market, we expect more downside for the office market, especially in Central in 2009, despite rents remaining firm for the time being. However, in terms of earnings volatility, the landlords should still be cushioned by the rental reversion cycle. Great Eagle should have limited reversion pressure in 2009. Wharf and Swire also remain top picks because of their decentralised office and prime shopping mall exposure.

Stocks rebound from their recent trough discounts of over 50% to 32-39%

Picking the leaders in the sector

## Dissimilarity to the last bust

We were expecting property prices to fall by 41% from the peak in 2008. Given that prices have already fallen by 23%, we believe the remaining downside for the property market is about 20%. We have gone through a checklist of seven key parameters – loan-to-deposit ratio, corporate gearing, mortgage rate, income growth, wealth impact, housing supply and demographic changes. We conclude that on a scale of 1 to 10 (from best to worst), in all key aspects except for income growth, the Hong Kong current property market is much more sound than during the last peak in 1997. The main attributing factors supporting the property market are the lowered overall leverage of the economy, i.e., loan-to-deposit ratio and corporate gearing, stronger income growth, higher wealth effect from the stock market and much lower housing supply. While the higher wealth effect from the previous run in the stock and property markets is dissipating, lower overall leverage and the limited supply of housing over the next two to three years are not likely to change, thus, providing strong support to the property market.

Lower overall leverage in Hong Kong and substantially less residential supply are the main positive drivers for Hong Kong property

## Office downside in 2009

Despite the resilience of Central office rents so far, we expect them to decline by about 35% in 2009. Based on the 3Q08 headline effective rent of HK\$115/sq ft, as reported by Jones Lang LaSalle, and assuming rents remained flat in 4Q08, we expect the level to drop to about HK\$75/sq ft. This assumes that the financial industry will continue to contract in 2009. There is certainly upside risk to this. For example, if China's economy were to revive in 2H09 and the prospects for the equity market improve, a potential increase in the IPO pipeline could rejuvenate demand for office space from the financial services sector.

Expecting 35% downside for Central office rents in 2009

## Retail rents under pressure

We would not be surprised to see retail rents at mass and prime shopping malls fall by 20% and 15%, respectively, in 2009. Our view of a slightly smaller fall in retail rent for the prime shopping malls is based on: 1) increasing polarisation between prime and non-prime shopping malls during a downturn and 2) support from mainland tourist spending in Hong Kong on the potential opening up of more geographical coverage from the expansion of China's individual visitor scheme.

Potential changes to the China's individual visitor scheme could give the retail sector a boost

# Sector valuation

# Cheap but not distressed anymore

Hong Kong property stocks remain cheap compared with their historical average valuation at an average discount to NAV of 32% for the developers and 39% for the investors. However, except for Great Eagle, we would consider any of the stocks' valuations as distressed anymore. From the recent trough, the developers and investors have rebounded by an average of 41% and 34%, respectively, and the trough discounts were at 51% and 53%.

From the recent trough, developers and investors have rebounded by an average of 41% and 34%, and the trough discounts were at 51% and 53%

Source: Company data, Credit Suisse estimates

The significant rebound in property stocks was driven largely by improved transaction volume in the primary market, with the launches of La Grove and Peak One by SHKP and City 18 by Henderson Land in December and that these stocks were at a distressed valuation level. We believe that property prices have not yet finished their adjustment cycle. The latest rebound in the shares has just brought them back to a more reasonable level.

## Stick with the leaders

Given that the physical property market prices are expected to fall 20% further in 1H09 and then stay flat (after the recent 33-41% rebound from their trough), we believe that stocks are likely to remain in a narrow trading range until the economy stabilises, likely towards the end of the year. In the meantime, we continue to recommend the more defensive names among both developers and investors.

### **Cheung Kong Holdings (0001.HK, HK\$72.40, OUTPERFORM, TP HK\$91.60)**

At one point, Cheung Kong's stub discount to NAV had narrowed to about 5% with its rebound; it has now widened back to about 26%. At this level, it is not very attractive in relation to the sector average valuation of 32% and its own historical average of 35%. As a property stock, we believe it is fairly valued at the current level, despite its substantially locked-in earnings and its aggressive market strategy in clearing inventory. The key impetus for any valuation upside would be mainly from our positive view on Hutchison Whampoa (0013.HK, HK\$38.85, OUTPERFORM, TP HK\$69.20,) which we still expect to see 78% upside from the current level. Our target price of HK\$91.6 for Cheung Kong is based on a 20% holding company discount to our target price for Hutchison and a 20% discount to CKH's property assets.

Cheung Kong's property stub is not cheap; accumulate only for upside from Hutchison

### **Sun Hung Kai Properties (0016.HK, HK\$65.60, OUTPERFORM [V], TP HK\$84.06)**

From its trough discount of 46% in 2008, SHKP is currently trading at a discount of 30%, which is in line with the sector average valuation. The company's successful launch of the La Grove and Peak One has been a key driver for the rebound in the property sector. SHKP is targeting to launch the Cullinan project in West Kowloon after Chinese New Year, while soft marketing of this project has already begun with indicative pricing of over HK\$20,000/sq ft. We believe that sales progress and pricing of this project will drive the share up. On the other hand, the company's substantial investment property portfolio also provides a strong earnings base to cushion its earnings volatility. Our target price is based on a 10% discount to its estimated NAV of HK\$93.4.

Upcoming sale of the Cullinan likely the key catalyst

### **MTR Corporation (0066.HK, HK\$17.86, OUTPERFORM, TP HK\$24.87)**

This is a quasi-transportation and property stock. The transportation front of MTRC is considered defensive, in our view, as rail traffic tends to be less volatile in an economic downturn. The company's merger synergy with KCRC should continue to help cushion the rail business earnings as well. We expect the automatic fare adjustment to be effective from 1 July 2009. On the property development front, given the increasing bargaining power of the company over land supply, we expect its profit-sharing ratios with developers to stay high. We expect property development earnings contributions for 2008-09 to be from the Capitol and the Palazzo. Its earnings certainties from these are high as almost all the units have been sold. Our target price of HK\$24.87 is based on a 20% discount to its property assets and on a par with its real-related assets, which imply a blended discount of 8%.

Given the increasing bargaining power of the company over the land supply, we expect its profit-sharing ratios with developers to stay high

### **Great Eagle (0041.HK, HK\$8.70, OUTPERFORM, TP HK\$19.97)**

Great Eagle is the cheapest property stock in our coverage universe. There is overall pressure on the holding company's hotel operations in Boston and London. We expect the contribution from the hotel division to fall by 21% in FY09 and to account for 32% of operating earnings. More importantly, we believe the key driver is the company's holding in C-REIT (2778.HK, HK\$2.18, NOT RATED), the holder of Citibank Plaza and Langham Place. The current occupancy of Citibank Plaza is 98% with a passing rent of HK\$85/sq ft versus its latest achieved rent of HK\$120/sq ft. While we expect 35% downside in Central office rents in 2009, the building will have only 14% of leases up for renewal this year. In Langham Place, the offices are 99% occupied, with only 5.7% of leases up for renewal in 2009. This could help to avoid some pressure during the current market softness. For retail, the mall is close to 100% occupied and only 15% of leases are due for renewal in 2009. As the stock is currently trading at a 72% discount to NAV, we believe the stock is

Relatively less reversion pressure in 2009

one of the best ways to play the defensiveness of these two investment properties. Our target price is based on a target discount of 35%.

#### Swire Pacific 'A' (0019.HK, HK\$53.1, OUTPERFORM, TP HK\$75.90)

We have recently revised down our earnings forecasts for Swire by 3%, 21% and 14% for 2008-10E, respectively, as we cut our earnings estimates for Cathay on weaker traffic and yield assumptions, which are partially offset by lower fuel costs. Despite the substantial earnings cuts, Swire is trading at about 11x 2009E P/E. If we strip out Cathay, Swire is trading at just 9x 2009E P/E. In terms of valuation, Cathay is now only 7.7% of Swire's estimated NAV of HK\$94.9. The impact of any potential weakness on Swire's valuation should be minimal. We believe the company's decentralised office portfolio at Island East and its prime shopping mall at Pacific Place are likely to provide a strong cushion in the current downturn. The company's consistently conservative approach in China property expansion also makes it stand out in the current market environment. Our target price of HK\$75.9 is based on an average discount of 20% to its NAV of HK\$94.9.

Despite pressure from Cathay, Swire's property assets are trading at only 9x 2009E P/E

#### Wharf Holdings (0004.HK, HK\$21.00, OUTPERFORM, TP HK\$28.06)

Wharf has experienced one of the sharpest rebounds from its recent trough (+77%) among the property stocks, but we believe the company still has the most defensive qualities in terms of its exposure to prime shopping malls and decentralised office space in both Tsim Sha Tsui (TST) and Causeway Bay. The shopping malls at Harbour City and Times Squares recorded low single-digit YoY sales growth in October, which is not bad in the current environment. Office rents at the Gateway are standing firm at about HK\$40/sq ft with 97% occupancy, while Times Squares' office rents are at HK\$45/sq ft with 98% occupancy. Despite the overall pressure on office rents, similar to Island East, we believe the rental gap between TST and Central will provide a better cushion to the downside. The company originally was to pay about HK\$11 bn on outstanding land premium for its China land bank in 2009. However, the payment schedule has now been extended to over the next few years, removing a significant burden on its financial situation. Our target price of HK\$28.06 is based on a 25% discount to its NAV of HK\$37.5.

The China land premium payment schedule has now been extended to over the next few years, removing a significant burden on its financial situation

## Catalysts in 1H09

While property prices are likely to decline further in the coming months on the back of a rising unemployment rate (as in December), we believe the market is likely to react to any large-scale launches in 1H09. We believe the most prominent drivers will be SHKP's upcoming launch of the Cullinan and Sino/MTRC's Lake Silver. While we had seen very good take-up of the primary launches in December, those projects were relatively smaller with lower price tags. With the continued worsening of the employment picture, we are doubtful whether these upcoming launches will do well without any substantial reduction in price expectation.

Large-scale projects to be launched after the Chinese New Year

**Figure 11: Major primary launches in FY09 – mostly in the New Territories**

| District                    | Project name/address           | No. of units | Developer        |
|-----------------------------|--------------------------------|--------------|------------------|
| Ma On Shan                  | Lake Silver                    | 2,169        | Sino / MTRC      |
| West Kowloon (Tai Kok Tsui) | Long Beach Tower 1, 2, 7, 8, 9 | 1,104        | Hang Lung        |
| Yuen Long                   | Central Park Tower Phase 2     | 1,068        | Cheung Kong      |
| Kowloon Station             | The Cullinan                   | 825          | SHKP / MTRC      |
| Yuen Long                   | Ma Tin Road                    | 672          | New World        |
| West Kowloon (Tai Kok Tsui) | Cherry Bay project             | 522          | Nam Fung / URA   |
| Hung Hom                    | Harbour Place Tower 3          | 350          | New World / SHKP |
| West Kowloon (Tai Kok Tsui) | 33 Lai Chi Kok Road            | 107          | Henderson        |
| Kennedy Town                | The Sail at Victoria           | 95           | HKLand           |
| <b>Total</b>                |                                | <b>6,912</b> |                  |

Source: HKET, Credit Suisse estimates

For the Cullinan, for example, we expect an average selling price of HK\$16,000/sq ft. In the current soft marketing, SHKP still expects to fetch a price of over HK\$20,000/sq ft. Although the market has probably factored a much lower price assumption into its earnings forecasts, it would be a negative catalyst for the stock if the company fails to achieve its target. To avoid this sort of disappointment, we believe Sino will also launch its Lake Silver project in phases in order to test the market.

SHKP is looking for over HK\$20,000/sq ft for the Cullinan

In our view, the upcoming launches will be seen more as an excuse for the market to take profit rather than to continue chasing these stocks from current levels.

## Time to bottom fish now?

After the 23% fall in overall residential prices from their peak in 2008, we expect prices to drop a further 20% in 2009. We also expect a continued rise in the unemployment rate and the increasing negative wealth impact to be the key drivers of the last leg down for the property market. However, we believe the adjustment process will be done largely in 1H09. Office rents in Central had yet to fall in 3Q08, but we believe that a more dramatic drop is likely to come in 1Q09. The slowdown in domestic consumption and tourist arrival growth is starting to impact the retail sector. Tenants' sales at key shopping malls started to slow in October 2008.

Projecting a 20% fall in residential prices, concentrated mainly in 1H09

Source: Company data, Credit Suisse estimates

For the residential market, we believe its bottom is likely to be found towards the end of 2Q09 and then remain flat for the rest of the year. We expect the whole adjustment process to be much quicker than in the previous down cycle after the Asian financial crisis, as the overall leverage level in the economy is significantly less this time and the potential supply/demand imbalance should provide a strong cushion to the downside.

## Stocks move as a sector

Property stocks in Hong Kong, despite their different asset mixes, tend to move in tandem as a sector. Based on the past three troughs in the property market, 1995, 1998 and 2003, property stocks tended to lead the physical property market by about 40, 8-9 and 15-16 weeks, respectively. Averaging the past three troughs, property stocks led the property market by about 20 weeks or five months. It is also interesting to note that there is not much difference in the lead time between stocks and the whole sector tends to move together when factoring in a rebound in property prices.

Averaging the last three troughs, property stocks led the property market by about 20 weeks or five months

**Figure 13: Stock performance leading the physical property prices (weeks)**

As we are expecting property prices to bottom out towards the end of 1H09, we believe that property stocks will probably start to bottom out in February. However, we expect property stocks to stay flat at least until 2H09, as property prices are not likely to see a major rebound until the economic outlook starts to brighten, likely towards the year-end.

## What has the valuation discounted?

Although property stocks are not trading at distressed levels anymore, after the recent rebound, their current share prices (assuming they are trading at their historical average discount to NAV) are pricing in a further 40% fall in residential prices and a 30-40% fall in office and retail rents. We believe the adjustment process of the property market has yet to be completed, but the magnitude of the correction will still be much lower than what current prices are implying. In the case of SHKP, if we assume an additional 30% reduction in property prices (on top of our current forecast of 20% downside), and office and retail rents, its NAV would be reduced to about HK\$78 from HK\$93.4. Based on its historical average discount of 9%, the stock should be fairly valued at HK\$70.7 versus its current share price of HK\$65.6. However, if one is bearish and applies its historical trough discount of 49%, this implies downside of 39% to HK\$39.8. We believe this approach best gauges the bottom of its trading range if extreme market pessimism prevails, but it is not a good way to estimate its fair value given the double-counting impact of using trough discounts to trough NAV estimates.

Property stocks are now pricing in a 40% fall in residential prices and a 30-40% fall in office and retail rents

Figure 22: Sensitivity of NAVs to further price drop assumptions

|                | RIC     | Price (HK\$) | NAV (HK\$) | Further down in assumptions |                 |                 | Avg. disc. (%) | Further down in assumptions |                        |                        | Further down in assumptions |                |                |

# Dissimilarity to the last bust

## Hong Kong property fundamentally sound

Despite the severity and state of the current global financial crisis, we believe the current health of the Hong Kong's property market is much stronger than during the Asian financial crisis in 1997-98. Property prices on average fell by about 65% from the peak in 1997 during the last crisis period and the entire deleveraging process took roughly six years, with the last leg of the downturn exacerbated by the SARS outbreak in 2003. Although property prices have more than doubled from the trough in 2003 to the peak in 2008, the average price level was still about 30% below the peak in 1997.

Despite the fact that property prices have more than doubled from the trough in 2003 to the peak in 2008, the average price level is still about 30% below the peak in 1997

**Figure 35: Property Price Index movement since the last cycle**

Source: CEIC, Credit Suisse estimates

The fundamentals of the property market are also considered much healthier *now* than during the peak level in 1997. We have compiled a checklist of seven key parameters to access and compare the "health" of the property market with the last peak cycle. The factors underlying the property market that we examined are loan-to-deposit ratio, corporate gearing, mortgage rate, income growth, wealth impact, housing supply and demographic changes.

**Figure 36: Peak Sept. 1997 (1 = best; 10 = worst)**

Source: CEIC, Credit Suisse

**Figure 37: Peak June 2008 (1 = best; 10 = worst)**

Source: CEIC, Credit Suisse

On a scale of 1 to 10 (1 being best and 10 worst), in all key aspects except for income growth, the Hong Kong property market even at the peak in 2008 was considered much healthier than what it was during the previous peak in 1997. The current state of the property *market* is also considered stronger than during its trough in 2003, even after a six-year asset deflation period.

**Figure 38: Trough 1998 Dec. (1 = best; 10 = worst)**

Source: CEIC, Credit Suisse

**Figure 39: Trough 2003 Sept. (1 = best; 10 = worst)**

Source: CEIC, Credit Suisse

The main attributing factors that support the property market are the lowered overall leverage of the economy, i.e., loan-to-deposit ratio and corporate gearing, stronger income growth, higher wealth effect from the stock market and a much lower housing supply. While the higher wealth effect from the previous run in the stock and property markets is dissipating, the overall lower leverage and limited supply of housing over the next two to three years are not likely to change, thus providing strong support for the property market. This is also one of the key reasons for our belief that a further fall in the property market will probably be confined to 20% in 2009, yet making it about 43% above its trough level in 2003.

The overall lower leverage and the limited supply of housing over the next two to three years are not likely to change thus providing a strong support to the property market

**Figure 40: Scores – property market health (1 = best, 10 = worst)**

|                       | 2008 peak (Jun 08) | 03 trough (Sept 03) | 98 trough (Dec 98) | 97 peak (Sept 97) |

## Mortgage rates

Although there is a risk of a further rise in mortgage rates, even in a worst-case scenario, we believe the absolute level would still be substantially lower than at the peak during the Asian financial crisis.

In the midst of the global financial crisis and with US target rates being set to almost zero, the Hong Kong 3M interbank rate has broken the 1% mark. This is the lowest level that we have seen since the trough in 2003. We believe that benchmark rates are unlikely to see any significant upward adjustment over the next 12 months, with the global economy struggling at its bottom. What is unusual this time, though, is that the Hong Kong prime rate and

mortgage rates are not coming down in line with the fall in global benchmark rates and the local inter-bank rates. If we simply look at the Prime-HIBOR spread, it is now back up to about 400 bp at the end of the year from a squeezed level of less than 100 bp in October 2008. The improved interest rate spread theoretically should have provided sufficient leeway for banks to lower lending rates.

**Figure 41: Hong Kong mortgage rates**

Source: CEIC

**Figure 42: Hong Kong interbank versus US Fed rates**

Source: CEIC

However, according our Hong Kong banks analyst, Chris Esson, there are two big challenges for local banks:

- **Weaker revenue.** The outlook for income generation is poor. Balance sheet growth is expected to be limited, margins should come under pressure as a result of heightened competition and non-interest income is likely to contract sharply given weak demand for wealth management products and declining consumer spending (hence credit card fee income).
- **Rising credit costs.** We expect credit costs to spike in 2009. Delinquency rates in corporate lending portfolios are forecast to rise sharply in early 2009, reflecting lower demand from developed markets. At the same time, we believe concern will grow over the outlook for consumer asset quality, given increased unemployment.

Weaker revenue growth and rising credit costs are reasons banks are not likely to lower mortgage rates

**Figure 43: Hong Kong Prime/HIBOR spread**

Source: Bloomberg

As a result, the improved interest rate spread serves only as a remedy to the overall decline in profitability for the banks and to compensate for the risk of anticipated rising credit costs.

**Figure 44: Latest mortgage rates in Hong Kong**

| Bank               | Mortgage rate (%)                     | Cash rebate (if any) (%)         | Effective interest rate (%) |

### Back to the prime-plus era

With the backdrop of a worsening profitability outlook for local banks, we believe there is a chance that Hong Kong mortgage rates could go back to the prime-plus era, as it was in before the late 1990s. While the prime rate is now being capped by the globally lowered benchmark rates, we believe the potential upside (the worse case) for mortgage rates would be about prime plus 175 bp. Using the prime rate of larger banks at 5%, this would indicate a worst-case mortgage rate of 6.75%. However, in absolute terms, this level would still be substantially lower than at the peak of 11.5% in 1998.

A worst-case for the mortgage rate is 6.75% if it goes back to prime +175 bp

**Figure 45: Mortgage rates moving towards prime level amid credit-tightening**

Source: CEIC

## Corporate gearing

Substantially lower leverage on the corporate balance sheets nowadays is a major positive in terms of avoiding a massive de-leveraging process as witnessed during the aftermath of the Asian financial crisis. Based on the Credit Suisse Hong Kong coverage universe, corporate gearing was about 9.2% at the end of 2008 versus the average of 22% for the six-year de-leveraging period after 1997. In other words, assuming the same absolute level of net borrowing, the equity base of these corporates would need to be at least halved to achieve a similar level of gearing.

Having said that, there is huge de-leveraging pressure in both the global financial and real estate markets. To some extent, the Hong Kong property market is also affected by the de-leveraging process of foreign companies when they offload their real estate holdings in Hong Kong. In our view, the initial fall in property prices in Hong Kong was driven mainly by these types of foreign investors unwinding their positions and the process has pretty much been done. Under normal circumstances, the global de-leveraging process would have been much more damaging if not for the global bailout efforts and the massive liquidity injection into the system. We believe that Hong Kong's property market also has marginally benefited in this regard.

The initial fall in property prices in Hong Kong was driven mainly by foreign investors unwinding their positions and the process is pretty much done

**Figure 46: Corporate gearing (Credit Suisse Hong Kong universe)**

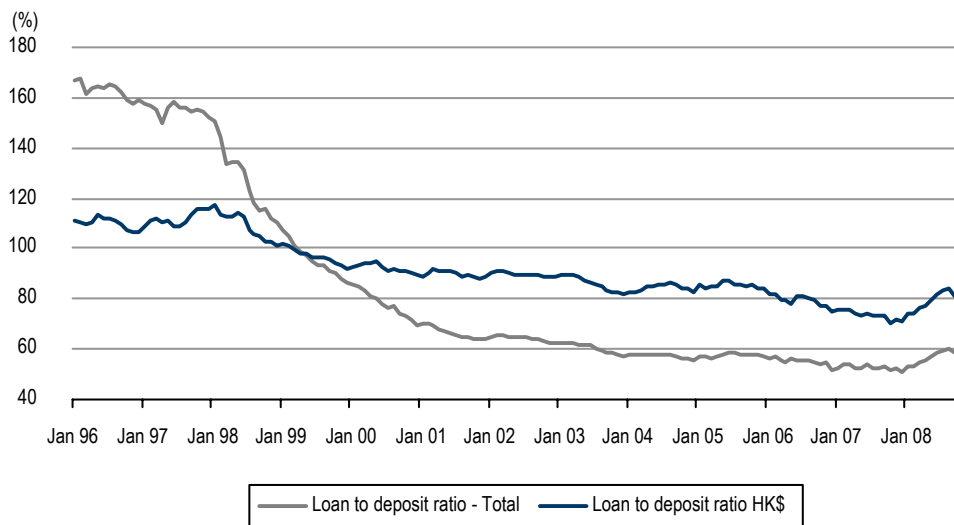

Source: Company data, Credit Suisse estimates

## Loan-to-deposit ratios

Apart from the corporate gearing levels of the listed Hong Kong companies, we believe another key gauge of the system leverage is banks' loan-to-deposit (L/D) ratios, which, to some extent, indicate the banks' aggressiveness in using their balance sheets. During 1997-98, the peak aggregated L/D ratio in Hong Kong was 117%, and it continued to fall to the recent level of 81%. On the one hand, this measure shows up nicely in our overall "healthiness" score of the property market, given that the amount of leverage on banks' balance sheets is limited. On the other hand, it does show the unwillingness of banks to lend on: 1) the competitive pricing of the lending rates, especially in the mortgage market and 2) their increased reliance on non-interest income streams. With a better margin on lending and rising pressure on non-interest income in 2009, we expect the L/D ratio could go up again. If a rise in mortgage rates has been priced into property prices, we believe the potential increase in bank lending could be positive for property market transaction volumes.

With a better margin on lending and rising pressure on non-interest income in 2009, we do expect there will be a chance of the L/D ratio to go up again

**Figure 47: Leveraging has kept narrowing since the Asian financial crisis**

## Unemployment rate

The unemployment rate is one area that scores well for the property market now, but momentum is definitely worsening. Despite its recent rise to about 3.6%, we believe this is still well below its equilibrium level. According to our economics team, the worsening global financial market and subsequent negative wealth impact on domestic consumption is expected to push the unemployment rate up to about 6% in 2009 versus the peak level of 6.5% in November 1999. While the first wave of layoffs was concentrated in the financial services sector, which employs a total of 164,000 people, we believe that unemployment from the wholesale, retail, trade, restaurant and hotels sectors is likely to be the main driver pushing the rate up further. When the Asian financial crisis began in September 1997, it took 27 months for the unemployment rate to peak in November 1999. Assuming that it takes about the same time to reach the peak unemployment rate, this implies that 3,140 workers would be laid off every month in Hong Kong, on average, which is quite extreme, in our view.

We believe the unemployment rate from the wholesale, retail, trade, restaurant and hotels sectors is likely to be the main driver pushing unemployment higher

**Figure 48: Unemployment rate expected to climb up to 6% by FY09**

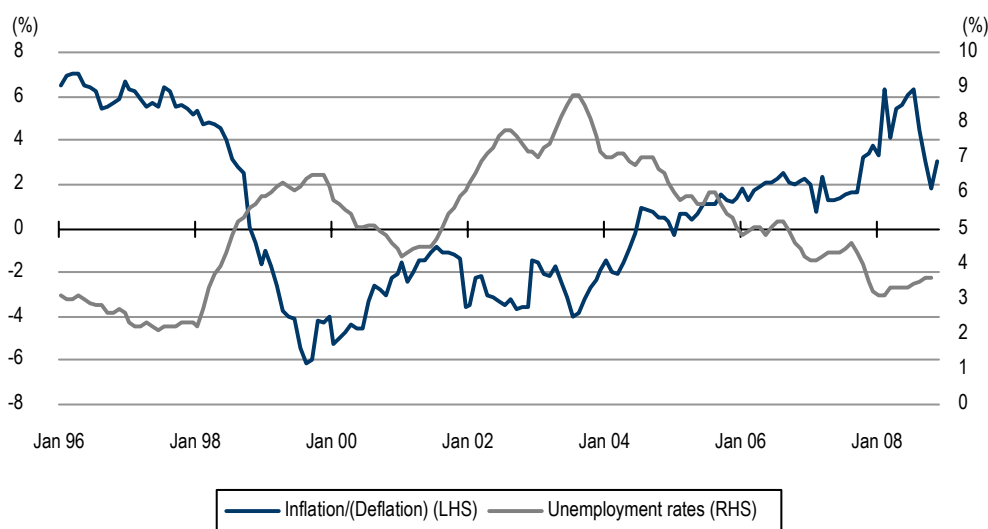

Source: CEIC, Company data, Credit Suisse estimates

Putting our economic team's view aside, we believe the big call is whether Hong Kong will return to a deflationary cycle, as witnessed during 1999-2003. The momentum of the Hong Kong CPI is definitely slowing down but the substantial deflationary cycle in Hong Kong was caused by a combination of an ultra high interest rate environment and substantial leverage in the system. None of these factors are prevailing in Hong Kong this time around. In our view, an internally induced prolonged deflationary cycle is quite unlikely to happen. With this in mind, we believe the chance of the local unemployment rate challenging its previous high is quite limited.

The big call is whether Hong Kong return to a deflationary cycle, as we witnessed during 1999-2003

With China being the growth engine of Hong Kong, the slowdown in its economy and the trading sector will have a direct negative impact on Hong Kong. However, we would not rule out China implementing policy measures that could help to cushion the downside risks to the economy. One example could be the expansion of geographical coverage for the individual visitor scheme from China, which could directly stimulate local tourism and the retail industry.

**Figure 49: Deflationary cycle caused a sharp jump in the unemployment rate**

Source: CEIC, Credit Suisse estimates

### How will the unemployment rate affect property prices?

The common belief is that so long as the affordability ratio stays at a low level, it will provide a strong support to property prices. We would argue that the affordability ratio will tend to contract when the unemployment rate starts to rise. As and when job security is in doubt, an average household will normally tend to allocate a smaller portion of income to mortgage payments for "safety" purposes. This relationship has generally held true for the past 15 years.

Based on our regression analysis between the Hong Kong unemployment rate and the affordability ratios for Hong Kong, Kowloon and the New Territories, we highlight the potential changes in the affordability ratios on the back of the potential increase in unemployment. The affordability ratios for Hong Kong, Kowloon and the New Territories are currently 68%, 54% and 40%, using the average price of type A, B and C for each of Hong Kong, Kowloon and the New Territories, as published by the government, and further assuming an average unit size of 500 sq ft, a mortgage rate of 4%, a mortgage term of 20 years and a loan-to-value ratio of 70%.

**Figure 50: Average residential property prices by district**

Source: CEIC

**Figure 51: Unemployment rates versus affordability ratios**

Source: CEIC, Credit Suisse estimates

If unemployment increases to 6%, according to the Credit Suisse economic team's projection, we believe the affordability ratios for Hong Kong, Kowloon and the New Territories will retreat to 51%, 38% and 34%, respectively. The market impacted most significantly would be Hong Kong Island property prices, where we would expect affordability to fall from 68% to 51%.

**Figure 52: Sensitivity of affordability ratios to unemployment rate**

|                        | Unemployment rate (%) |      |      |      |      |      |      |
|------------------------|-----------------------|------|------|------|------|------|------|
|                        | 3.0%                  | 3.5% | 4.0% | 4.5% | 5.0% | 5.5% | 6.0% |
| <b>Hong Kong</b>       | 74                    | 70   | 66   | 63   | 59   | 55   | 51   |
| <b>Kowloon</b>         | 63                    | 59   | 54   | 50   | 46   | 42   | 38   |
| <b>New Territories</b> | 56                    | 52   | 48   | 45   | 41   | 37   | 34   |

Source: CEIC, Credit Suisse estimates

According to our sensitivity analysis, assuming the mortgage rate stays at 4%, property prices in Hong Kong Island and Kowloon are expected to correct by a further 25% and 30%, respectively. This regression model could be a bit oversimplified but useful in showing the direction and the relative magnitude for changes in property prices.

**Figure 53: Sensitivity of property prices to changes in mortgage and unemployment rate**

| Hong Kong              | Unemployment rate (%) |      |      |      |      |      |      |

## Wealth creation

Given the high correlation between the property and stock markets, the interlinked wealth effect is considered enormous. In fact, stock market returns tend to lead the property market by about 8-12 weeks with a 58% correlation. The positive wealth effect during the 1997 property market peak was much stronger considering the yearly returns from the stock market since 1991 were all positive, except in 1994, until the Asian financial crisis began in September 1997. Similarly, the stock market provided decent returns between 2003 and the beginning of 2008. Having said that, the momentum of this positive wealth impact has started to fade, as the property market peaked in June 2008. The dramatic correction in the stock market is likely to provide a big cap on the property market for the next three to six months. The de-leveraging of structured financial products in the market, which were one of the hottest investment choices at the beginning of 2008, is likely to be a drag on the purchasing or investment appetite for high-grade properties.

Stock market returns tend to lead the property market by about 8-12 weeks with a 58% correlation

## Supply

The limited number of residential units to be completed in the coming few years is one of the key reasons for our belief that the current property market downturn will not be as severe as the previous one. The supply of residential units estimated by the government in 2008 and 2009 is 8,940 and 10,670, respectively, while the average annual supply of the last ten years was about 23,000 units.

While we do not yet have the latest forecasts from the government for the new supply coming through in 2010, judging from the commencement of work granted in 2007 and 2008, we would expect the supply level to be at around 10,000 units.

The supply of the residential units estimated by the government in 2008 and 2009 are 8,940 and 10,670, respectively

**Figure 57: Residential supply remains at low level in 2009**

Source: HK Government, Company data, Credit Suisse estimates

To a large extent, the fall in the supply of residential units is driven by the government's stance on land supply. The amount of land sales through land auction has fallen substantially since 2001. Through the use of an application list system, the government has been criticised by developers of having a tough stance on the floor price of the land and effectively adopting its previous high land price policy. The result is that there will be a squeeze in residential unit supply in the medium term, which could help to cushion the downside for the residential market.

The significant property price correction after the Asian financial crisis was driven by shrinkage in demand as both end-users and investors lost their financial ability to buy. However, the significant increase in supply from both the private and public sectors also aggravated the downward adjustment cycle. In 2008, although demand also started to fade, driven by the negative wealth effect and the rise in unemployment, residential supply is limited and counters this fall in demand.

## Demographics

Although the basic demographics in Hong Kong has not changed much over time, with average population growth of only about 0.7% over the past 12 years, the number of households formed has been quite steady at an average of 37,500 per year. The rise in the number of marriages since 2003 has also led to a small baby boom since 2005. For the past 12 years, the annual average take-up of primary private and public residential sales was 25,000 per year.

This sort of average annual demand may not necessarily be realised when the economy is in the doldrums. However, steady household formations from new marriages and the increase in net births should transform into strong pent-up demand once the economy stabilises. In any case, when the annual supply of primary residential units amounts to only an average of 10,000 units per year, we expect a strong supply/demand imbalance is in the making. With the right ingredients in place, i.e., a stable economy, improving stock market, persistent low interest rate environment with a better credit outlook, we believe there is a risk that the property market could *encounter* another asset price boom.

The number of households formed has been quite steady at an average of 37,500 per year

**Figure 60: Household formation number exceeds take-up of primary residential units**

|                | Marriage      | New birth     | Household formation | Annual take-up |

# Office downside in 2009

## Rents not falling yet but demand softening quickly

According to Jones Lang LaSalle's numbers and our conversations with the major landlords, office rent stayed firm in 3Q FY08, with Central office rents edging up about 1%. New demand has definitely slowed down, but there are no signs of major negative take-up yet. However, we believe the real impact on the office market from the economic slowdown and the rise in unemployment will take time to filter through. The local unemployment rate has just started to move up and is still hovering at less than 4%. The last time, when we saw the unemployment rate hit 6% in 1998, the overall office vacancy rate was close to 12%, compared with 6% now.

We believe the real impact to the office market from the slowing in the economy and the rise in unemployment will take time to filter through in 2009

**Figure 67: Unemployment rate drove office vacancies**

Source: CEIC, Company data, Credit Suisse

Assuming there is no take-up of new additions in 2009, we expect the overall vacancy rate for office property to go up to about 12.2%, with Kowloon East being the hardest hit area, as 191,101 sq m of supply is expected to be completed in 2009. Also, its vacancy rate is likely to go up to 41% from 28% if there is no positive take-up. With the same assumption, the vacancy rate in TST should rise from the current 4.5% to 15.6%, with the addition of 127,667 sq m from ICC. Fortunately, most of the ICC building has already been pre-leased, so the new space will not really be hitting the market hard.

Assuming there is no take-up of new additions in 2009, we expect the overall vacancy rate for office to rise to about 12.2%

**Figure 68: Office vacancy rates scenario: 3Q08 actual versus FY09 base case versus FY09 worst case**

## We expect a 35% fall in Central office rents

Despite the resilience of Central office rents so far, we expect this to decline by about 35% in 2009. Based on the 3Q FY08 headline effective rent of HK\$115/sq ft, as reported by Jones Lang LaSalle, and assuming rents to stay flat in 4Q08, we expect it to drop to about HK\$75/sq ft level. In our earnings forecasts, we had forecast the reversion rents for some other Central grade-A office buildings to be about HK\$45-50/sq ft. We arrived at this by assuming that the financial industry will continue to contract in 2009. There is certainly upside risks to this. Assuming that China's economy revives in 2H09 and the prospects for the equity market improve, a potential increase in the IPO pipeline could rejuvenate demand for office space from the financial services sector.

Based on the 3Q08 headline effective rent of HK\$115/sq ft, as reported by Jones Lang LaSalle, and assuming rents stayed flat in 4Q08, we expect the level to drop to about HK\$75/sq ft

**Figure 69: Major new offices in FY09**

Source: HKET, company data, Credit Suisse estimates

Our view on playing the decentralised office exposure is a relative call to the Central office market, to which we believe office rents in TST and Island East will fall in a smaller magnitude. While Central office rents are still at a high level, its rental gap with the decentralised areas such as Island East remains at a historically high level. Traditionally, decentralised office areas are less sensitive to contractions in the financial services sector. The only exception was in 2003, when there was a significant supply of grade-A office space from IFC II, which made Central office rents fall below HK\$20/sq ft, while Island East was at HK\$11/sq ft. This caused a major "centralisation" trend on the back of this narrowed rental gap.

The significant increase in grade-A office supply in Kowloon East would, of course, raise concern on an overall rise in vacancy rates. Despite its attractively priced rental level, we are not seeing Kowloon East pulling any major tenants out of the traditional office areas yet.

Overall, we expect rents in decentralised areas such as TST and Island East to fall by about 25% to HK\$32/sq ft and HK\$34/sq ft, respectively, at the end of 2009.

# Retail rents under pressure

## Consumer durables are the hardest hit areas

Along with the negative wealth impact and rising unemployment rate, Hong Kong retail sales growth was down to 0% and -4% in October in terms of value and volume, respectively. The hardest hit areas are clothing and apparel (-7%), consumer durables (-7%), motor vehicles (-23%), jewellery and watches (-2%). These are high-value-added items, which are expected to be most affected when the wealth of higher-income classes are affected by the negative the wealth effect from the stock market. During the last downturns in 1998 and 2003, retail sales dropped by as much as 20% and 13%, respectively. Similar to the office market, we have yet to see the worst, as retail sales and rents tend to lag.

The hardest hit areas of slowing retail sales are clothing and apparel (-7%), consumer durables (-7%), motor vehicles (-23%), jewellery and watches (-2%)

**Figure 82: Retail sales value and volume on a downward trend**

Source: CEIC

## Mass and prime retail rents to fall by 20% and 15%

We would not be surprised to see retail rents of mass and prime shopping malls fall by 20% and 15%, respectively, in 2009, although most major landlords are not feeling major downward pressure on rents yet. The "turnover rent" portion, though, will probably be eroded quickly. Our view on the slightly smaller fall in retail rent for prime shopping malls is based on: 1) the increasing polarisation between prime and non-prime shopping malls during a downturn and 2) the support from mainland tourist spending in Hong Kong. Regarding mainland tourist arrivals, although growth is likely to slow, due to the economic slowdown, the opening up of more geographical coverage from the expansion of the individual visitor scheme is likely to provide a strong cushion to shopping malls that are key destinations for Chinese tourists.

Our view on the slightly smaller retail rent fall for prime shopping malls is based on the increasing polarization between prime and non-prime shopping malls during a downturn and the support from mainland tourist spending in Hong Kong

We believe that traditionally large shopping malls such as Harbour City, Times Square, Pacific Place and Langham Place will continue to do relatively well due to the support from tourist traffic. Furthermore, localised shopping centres that cater mainly to the daily needs of local residents should also prove to be more defensive. However, smaller shopping malls could be more prone to a rise in vacancy rates as their tenants tend to be financially weaker to sustain a prolonged downturn. The tenants of prime malls, though, are usually more established brand names with stronger balance sheets and may weather this sort of environment better. The chance of the tenants "failing" is relatively small in this regard, in our view.

## Disclosure Appendix

### Important Global Disclosures

Cusson Leung, CFA, Joyce Kwok, Raymond Cheng, CFA & Ronney Cheung each certify, with respect to the companies or securities that he or she analyzes, that (1) the views expressed in this report accurately reflect his or her personal views about all of the subject companies and securities and (2) no part of his or her compensation was, is or will be directly or indirectly related to the specific recommendations or views expressed in this report.

The analyst(s) responsible for preparing this research report received compensation that is based upon various factors including Credit Suisse's total revenues, a portion of which are generated by Credit Suisse's investment banking activities.

#### Analysts' stock ratings are defined as follows\*\*\*:

**Outperform (O):** The stock's total return is expected to exceed the industry average\* by at least 10-15% (or more, depending on perceived risk) over the next 12 months.

**Neutral (N):** The stock's total return is expected to be in line with the industry average\* (range of  $\pm 10\%$ ) over the next 12 months.

**Underperform (U)\*\*:** The stock's total return is expected to underperform the industry average\* by 10-15% or more over the next 12 months.

*\*The industry average refers to the average total return of the relevant country or regional index (except with respect to Europe, where stock ratings are relative to the analyst's industry coverage universe).*

*\*\*In an effort to achieve a more balanced distribution of stock ratings, the Firm has requested that analysts maintain at least 15% of their rated coverage universe as Underperform. This guideline is subject to change depending on several factors, including general market conditions.*

*\*\*\*For Australian and New Zealand stocks a 7.5% threshold replaces the 10% level in all three rating definitions, with a required equity return overlay applied.*

**Restricted (R):** In certain circumstances, Credit Suisse policy and/or applicable law and regulations preclude certain types of communications, including an investment recommendation, during the course of Credit Suisse's engagement in an investment banking transaction and in certain other circumstances.

**Volatility Indicator [V]:** A stock is defined as volatile if the stock price has moved up or down by 20% or more in a month in at least 8 of the past 24 months or the analyst expects significant volatility going forward.

#### Analysts' coverage universe weightings are distinct from analysts' stock ratings and are based on the expected performance of an analyst's coverage universe\* versus the relevant broad market benchmark\*\*:

**Overweight:** Industry expected to outperform the relevant broad market benchmark over the next 12 months.

**Market Weight:** Industry expected to perform in-line with the relevant broad market benchmark over the next 12 months.

**Underweight:** Industry expected to underperform the relevant broad market benchmark over the next 12 months.

*\*An analyst's coverage universe consists of all companies covered by the analyst within the relevant sector.*

*\*\*The broad market benchmark is based on the expected return of the local market index (e.g., the S&P 500 in the U.S.) over the next 12 months.*

#### Credit Suisse's distribution of stock ratings (and banking clients) is:

|                           | Global Ratings Distribution |                       |
|---------------------------|-----------------------------|-----------------------|
| <b>Outperform/Buy*</b>    | 38%                         | (60% banking clients) |
| <b>Neutral/Hold*</b>      | 44%                         | (56% banking clients) |
| <b>Underperform/Sell*</b> | 16%                         | (49% banking clients) |
| <b>Restricted</b>         | 2%                          |                       |

*\*For purposes of the NYSE and NASD ratings distribution disclosure requirements, our stock ratings of Outperform, Neutral, and Underperform most closely correspond to Buy, Hold, and Sell, respectively; however, the meanings are not the same, as our stock ratings are determined on a relative basis. (Please refer to definitions above.) An investor's decision to buy or sell a security should be based on investment objectives, current holdings, and other individual factors.*

Disclaimers continue on next page.

This report is not directed to, or intended for distribution to or use by, any person or entity who is a citizen or resident of or located in any locality, state, country or other jurisdiction where such distribution, publication, availability or use would be contrary to law or regulation or which would subject Credit Suisse, the Swiss bank, or its subsidiaries or its affiliates ("CS") to any registration or licensing requirement within such jurisdiction. All material presented in this report, unless specifically indicated otherwise, is under copyright to CS. None of the material, nor its content, nor any copy of it, may be altered in any way, transmitted to, copied or distributed to any other party, without the prior express written permission of CS. All trademarks, service marks and logos used in this report are trademarks or service marks or registered trademarks or service marks of CS or its affiliates.

The information, tools and material presented in this report are provided to you for information purposes only and are not to be used or considered as an offer or the solicitation of an offer to sell or to buy or subscribe for securities or other financial instruments. CS may not have taken any steps to ensure that the securities referred to in this report are suitable for any particular investor. CS will not treat recipients as its customers by virtue of their receiving the report. The investments or services contained or referred to in this report may not be suitable for you and it is recommended that you consult an independent investment advisor if you are in doubt about such investments or investment services. Nothing in this report constitutes investment, legal, accounting or tax advice or a representation that any investment or strategy is suitable or appropriate to your individual circumstances or otherwise constitutes a personal recommendation to you. CS does not offer advice on the tax consequences of investment and you are advised to contact an independent tax adviser. Please note in particular that the bases and levels of taxation may change.

CS believes the information and opinions in the Disclosure Appendix of this report are accurate and complete. Information and opinions presented in the other sections of the report were obtained or derived from sources CS believes are reliable, but CS makes no representations as to their accuracy or completeness. Additional information is available upon request. CS accepts no liability for loss arising from the use of the material presented in this report, except that this exclusion of liability does not apply to the extent that liability arises under specific statutes or regulations applicable to CS. This report is not to be relied upon in substitution for the exercise of independent judgment. CS may have issued, and may in the future issue, a trading call regarding this security. Trading calls are short term trading opportunities based on market events and catalysts, while stock ratings reflect investment recommendations based on expected total return over a 12-month period as defined in the disclosure section. Because trading calls and stock ratings reflect different assumptions and analytical methods, trading calls may differ directionally from the stock rating. In addition, CS may have issued, and may in the future issue, other reports that are inconsistent with, and reach different conclusions from, the information presented in this report. Those reports reflect the different assumptions, views and analytical methods of the analysts who prepared them and CS is under no obligation to ensure that such other reports are brought to the attention of any recipient of this report. CS is involved in many businesses that relate to companies mentioned in this report. These businesses include specialized trading, risk arbitrage, market making, and other proprietary trading.

Past performance should not be taken as an indication or guarantee of future performance, and no representation or warranty, express or implied, is made regarding future performance. Information, opinions and estimates contained in this report reflect a judgement at its original date of publication by CS and are subject to change without notice. The price, value of and income from any of the securities or financial instruments mentioned in this report can fall as well as rise. The value of securities and financial instruments is subject to exchange rate fluctuation that may have a positive or adverse effect on the price or income of such securities or financial instruments. Investors in securities such as ADR's, the values of which are influenced by currency volatility, effectively assume this risk.

Structured securities are complex instruments, typically involve a high degree of risk and are intended for sale only to sophisticated investors who are capable of understanding and assuming the risks involved. The market value of any structured security may be affected by changes in economic, financial and political factors (including, but not limited to, spot and forward interest and exchange rates), time to maturity, market conditions and volatility, and the credit quality of any issuer or reference issuer. Any investor interested in purchasing a structured product should conduct their own investigation and analysis of the product and consult with their own professional advisers as to the risks involved in making such a purchase.

Some investments discussed in this report have a high level of volatility. High volatility investments may experience sudden and large falls in their value causing losses when that investment is realised. Those losses may equal your original investment. Indeed, in the case of some investments the potential losses may exceed the amount of initial investment, in such circumstances you may be required to pay more money to support those losses. Income yields from investments may fluctuate and, in consequence, initial capital paid to make the investment may be used as part of that income yield. Some investments may not be readily realisable and it may be difficult to sell or realise those investments, similarly it may prove difficult for you to obtain reliable information about the value, or risks, to which such an investment is exposed.
